

The recent bycatch amount does not affect the fish population in New Zealand!

What we should be concerned for is Global Warming and temperature risings affecting our fish populations!

Year vs Temperature

Fluxating curves each year due to pollution and other enviromental impacts are leading to a decrease in fish population!

Data from 4 different water regions around New Zealand, stating their mean temperature each year.

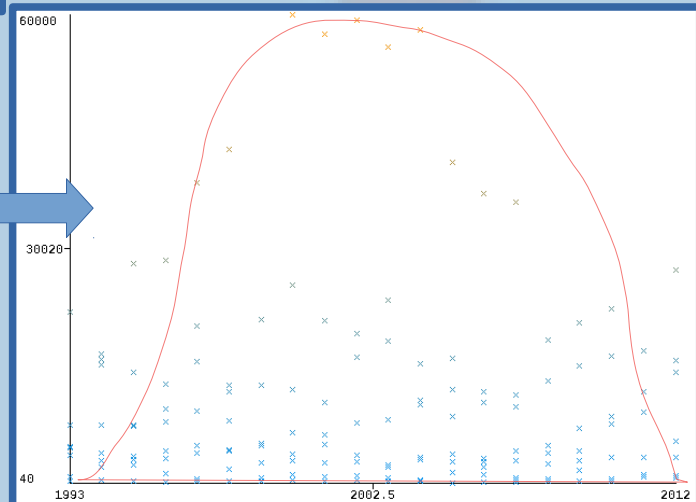

There is a strong negative correlation with estimated trawling amount in the past 20 years

Year vs Trawl Amount

Because we are trawling significantly less, we are bycatching less amounts of fish!

Our bycatch rate has decreased significantly over the past 10 years, across 8 examined fish species

Year vs Bycatch Amount
